1. Introdução

Foram realizadas simulações com os algoritmos de Gradiente Normalizado, Least-Square Normalizado e sua versão modificada com múltiplas parametrizações. As análises consideraram:

- Ordem da planta: $n = 2, 3, 4$
- Grau relativo: $n^* = 1, 2, 3$
- Variações: sinal de excitação, ganho de adaptação e condições iniciais

Avaliou-se a convergência dos parâmetros, a velocidade de adaptação e as mudanças a diferentes condições de simulação (variando ganhos, sinal de referência e condição inicial) dos algoritmos. A seguir, apresentamos os principais resultados e comparações entre os métodos.

2. Resultados das Simulações

2.1. Gradiente Normalizado - 2ª Ordem

Aqui iremos expor os resultados obtidos segundo o método do gradiente normalizado para 3 parametrizações diferentes. As situações de simulação são, respectivamente:

1. Caso base, utilizando uma onda quadrada como sinal de referência
2. Alterando o sinal de referência ao adicionar uma componente senoidal
3. Aumentando o ganho de adaptação gamma
4. Dando uma condição inicial ao sistema ($y(0) = 3$)

Começando por um sistema de 2ª ordem e progredindo até 4ª ordem

2.1.1 - Base

Planta: $N(s)/D(s)$

$$N(s) = b_1 s + b_0$$

$$D(s) = s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_1 = 2.5$ $a_0 = 1.5$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_1 = 2 \quad \lambda_0 = 1$$

$$\Gamma_i = 1I$$

$$K_i = 1$$

$$\begin{aligned} \text{C.I.: } x(0) &= [0 \ 0]^T \\ \theta(0) &= [0 \ 0 \ 0 \ 0]^T \end{aligned}$$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.1.1 - Base

2.1.2 - Componente senoidal

Planta: $N(s)/D(s)$

$$N(s) = b_1 s + b_0$$

$$D(s) = s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_1 = 2.5$ $a_0 = 1.5$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_1 = 2 \quad \lambda_0 = 1$$

$$\Gamma_i = 1I$$

$$K_i = 1$$

C.I.: $x(0) = [0 \ 0]^T$
 $\theta(0) = [0 \ 0 \ 0 \ 0]^T$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t)) + 0.5 \sin(\pi t)$

2.1.2 - Componente senoidal

2.1.3 - Gamma = 100

Planta: $N(s)/D(s)$

$$N(s) = b_1 s + b_0$$

$$D(s) = s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_1 = 2.5$ $a_0 = 1.5$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_1 = 2 \quad \lambda_0 = 1$$

$$\Gamma_i = 100$$

$$K_i = 1$$

$$\text{C.I.: } \begin{aligned} x(0) &= [0 \ 0]^T \\ \theta(0) &= [0 \ 0 \ 0 \ 0]^T \end{aligned}$$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.1.3 - Gamma = 100

2.1.4 - Condição inicial

Planta: $N(s)/D(s)$

$$N(s) = b_1 s + b_0$$

$$D(s) = s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_1 = 2.5$ $a_0 = 1.5$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_1 = 2 \quad \lambda_0 = 1$$

$$\Gamma_i = 1I$$

$$K_i = 1$$

C.I.: $x(0) = [3 \ 0]^T$
 $\theta(0) = [0 \ 0 \ 0 \ 0]^T$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.1.4 - Condição inicial

2.1.5 - $n^*=2$

2.2. Least-Square Normalizado - 2ª Ordem

Aqui iremos expor os resultados obtidos segundo o método dos mínimos quadrados; inicialmente para as mesmas 3 parametrizações e posteriormente apenas para a primeira. As situações de simulação são, respectivamente:

1. Caso base, utilizando uma onda quadrada como sinal de referência
2. Alterando o sinal de referência ao adicionar uma componente senoidal
3. Aumentando o ganho de adaptação γ
4. Dando uma condição inicial ao sistema ($y(0) = 3$)

2.2.1 - Base

Planta: $N(s)/D(s)$

$$N(s) = b_1 s + b_0$$

$$D(s) = s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\text{Lambda}(s) = s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_1 = 2.5$ $a_0 = 1.5$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_1 = 2 \quad \lambda_0 = 1$$

$$K_i = 1$$

C.I.: $x(0) = [0 \ 0]^T$

$$\theta(0) = [0 \ 0 \ 0 \ 0]^T$$

$$P(0) = 1I$$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.2.1 - Base

2.2.2 - Componente senoidal

2.2.3 - Gamma = 100

2.2.4 - Condição inicial

2.2.5 - $n^*=2$

2.3. Gradiente Normalizado - 3ª Ordem

Repetindo o mesmo esquema para a apresentação dos gráficos das simulações, agora para sistemas de 3ª ordem.

2.3.1 - Base

Planta: $N(s)/D(s)$

$$N(s) = b_2 s^2 + b_1 s + b_0$$

$$D(s) = s^3 + a_2 s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^3 + \lambda_2 s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_2 = 2$ $a_1 = 2.5$ $a_0 = 1.5$ $b_2 = 3$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_2 = 3$$
 $\lambda_1 = 2$ $\lambda_0 = 1$

$$\Gamma_i = 1I$$

$$K_i = 1$$

C.I.: $x(0) = [0 \ 0 \ 0]^T$
 $\theta(0) = [0 \ 0 \ 0 \ 0 \ 0 \ 0]^T$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.3.1 - Base

2.3.2 - Componente senoidal

2.3.3 - Gamma = 100

2.3.4 - Condição inicial

2.3.5 - $n^*=2$

2.3.6 - $n^* = 3$

2.4. Least-Square Normalizado - 3ª Ordem

A partir desta, as simulações do método de mínimos quadrados normalizado serão feitas para apenas uma parametrização.

2.4.1 - Base

Planta: $N(s)/D(s)$

$$N(s) = b_2 s^2 + b_1 s + b_0$$

$$D(s) = s^3 + a_2 s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^3 + \lambda_2 s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_2 = 2$ $a_1 = 2.5$ $a_0 = 1.5$ $b_2 = 3$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_2 = 3$$
 $\lambda_1 = 2$ $\lambda_0 = 1$

$$K_i = 1$$

C.I.: $x(0) = [0 \ 0 \ 0]^T$

$$\theta(0) = [0 \ 0 \ 0 \ 0 \ 0 \ 0]^T$$

$$P(0) = I$$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.4.1 - Base

2.4.2 - Componente senoidal

2.4.3 - Gamma = 100

2.4.4 - Condição inicial

2.4.5 - $n^*=2$

2.4.6 - $n^* = 3$

2.5. Gradiente Normalizado - 4^a Ordem

2.5.1 - Base

Planta: $N(s)/D(s)$

$$N(s) = b_3 s^3 + b_2 s^2 + b_1 s + b_0$$

$$D(s) = s^4 + a_3 s^3 + a_2 s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^4 + \lambda_3 s^3 + \lambda_2 s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_3 = 5$ $a_2 = 3$ $a_1 = 1$ $a_0 = 1.5$ $b_3 = 3.5$ $b_2 = 3$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_3 = 4$$
 $\lambda_2 = 3$ $\lambda_1 = 2$ $\lambda_0 = 1$

$$\Gamma_i = 1I$$

$$K_i = 1$$

C.I.: $x(0) = [0 \ 0 \ 0 \ 0]^T$
 $\theta(0) = [0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0]^T$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.5.1 - Base

2.5.2 - Componente senoidal

2.5.3 - Gamma = 100

2.5.4 - Condição inicial

2.5.5 - $n^*=2$

2.5.6 - $n^* = 3$

2.5.7 - $n^*=4$

2.6. Least-Square Normalizado - 4^a Ordem

2.6.1 - Base

Planta: $N(s)/D(s)$

$$N(s) = b_3 s^3 + b_2 s^2 + b_1 s + b_0$$

$$D(s) = s^4 + a_3 s^3 + a_2 s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\lambda(s) = s^4 + \lambda_3 s^3 + \lambda_2 s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_3=5$ $a_2=3$ $a_1=1$ $a_0=1.5$ $b_3=3.5$ $b_2=3$ $b_1=2$ $b_0=0.8$

$$\lambda_3=4$$
 $\lambda_2=3$ $\lambda_1=2$ $\lambda_0=1$

$$K_i = 1$$

C.I.: $x(0) = [0 \ 0 \ 0 \ 0]^T$

$$\theta(0) = [0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0]^T$$

$$P(0) = 1I$$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.6.1 - Base

2.6.2 - Componente senoidal

2.6.3 - Gamma = 100

2.6.4 - Condição inicial

2.6.5 - $n^* = 2$

2.6.6 - $n^* = 3$

2.6.7 - $n^*=4$

2.7. Least-Square Normalizado - Desafio

Planta: $N(s)/D(s)$

$$N(s) = b_1 s + b_0$$

$$D(s) = s^2 + a_1 s + a_0$$

Filtro: $1/\lambda(s)$

$$\text{Lambda}(s) = s^3 + \lambda_2 s^2 + \lambda_1 s + \lambda_0$$

Parâmetros: $a_1 = 2.5$ $a_0 = 1.5$ $b_1 = 2$ $b_0 = 0.8$

$$\lambda_2 = 3 \quad \lambda_1 = 2 \quad \lambda_0 = 1$$

$$K_i = 1$$

C.I.: $x(0) = [0 \ 0]^T$

$$\theta(0) = [0 \ 0 \ 0 \ 0]^T$$

$$P(0) = 1I$$

Input: $1 + 2 \operatorname{sign}(\sin(0.1 \pi t))$

2.7. Least-Square Normalizado - Desafio

3. Comentários dos resultados

Caso nominal

Percebe-se que o erro aproxima-se de zero e fica limitado para todas as parametrizações.

Vale destacar que a solução ótima não foi obtida dentro do período de simulação, tendo um efeito explícito nos picos do erro quando o sinal da onda quadrada troca do nível alto para o baixo ou vice-versa.

Mudança do sinal de referência

Por ser um sinal mais rico, contendo uma componente senoidal, há uma leve melhora no resultado da adaptação, mas não o suficiente para atingir a solução ótima.

O padrão do erro também se torna mais ruidoso, já que fora dos ganhos ótimos a planta tem mais dificuldade para seguir o modelo quando excitada por sinais com componentes frequenciais.

Aumento do ganho de adaptação

Observa-se uma diminuição do valor absoluto do erro, uma resposta de adaptação mais rápida e que se aproxima um pouco mais do valor ótimo.

Aqui é necessário cautela, porque o aumento do ganho pode gerar comportamentos inesperados se combinados com outras situações de simulação como por exemplo condições iniciais no sistema.

Condições iniciais

O principal efeito das condições iniciais no sistema é um pico no valor inicial do erro; passado um tempo o comportamento do sistema assemelha-se ao caso nominal.

A presença das condições iniciais exige uma análise detalhada para o uso dos ganhos de adaptação já que esses baseiam-se no erro de para atualizar os valores dos parâmetros identificados e esse erro apresenta um pico em $t = 0$.
